

# Effective User Stories for Agile Requirements

Mike Cohn  
August 14, 2007

1

## Mike Cohn - background

2

# What problem do stories address?

- Software requirements is a communication problem
- Those who want the software must communicate with those who will build it

© Mountain Goat Software, LLC

3

# Balance is critical

- If either side dominates, the business loses
- If the business side dominates...
  - ...functionality and dates are mandated with little regard for reality or whether the developers understand the requirements
- If the developers dominate...
  - ...technical jargon replaces the language of the business and developers lose the opportunity to learn from listening

© Mountain Goat Software, LLC

4

# Resource allocation

- We need a way of working together so that resource allocation becomes a shared problem
- Project fails when the problem of resource allocation falls too far to one side

# Responsibility for resource allocation

## If developers shoulder the responsibility...

- May trade quality for additional features
- May only partially implement a feature
- May solely make decisions that should involve the business side

## If the business shoulders the responsibility...

- Lengthy upfront requirements negotiation and signoff
- Features are progressively dropped as the deadline nears

# Imperfect schedules

- We cannot perfectly predict a software schedule
  - As users see the software, they come up with new ideas
  - Too many intangibles
  - Developers have a notoriously hard time estimating
- If we can't perfectly predict a schedule, we can't perfectly say what will be delivered

## So what do we do?

We make decisions based on the information we have

...but do it often

Rather than making one all-encompassing set of decisions

...we spread decision-making across the project

This is where user stories come in

# Today's agenda

- What stories are
- Users and user roles
- Gathering stories
- INVEST in good stories
- Why user stories

A photograph of a hand holding a white notepad. The notepad has the text "What Stories Are" written on it. A red highlighter is on the left and a black pencil is at the bottom. The background is a light gray silhouette of a hand holding a notepad.

**What Stories Are**

## Poor requirements

Poor requirements are often listed as one of the chief causes of project failure.

1. What are some problems you can attribute to a poor requirements process?
2. What constitutes a poor requirements process?

## Ron Jeffries' Three Cs

### Card

- Stories are traditionally written on note cards.
- Cards may be annotated with estimates, notes, etc.

### Conversation

- Details behind the story come out during conversations with product owner

### Confirmation

- Acceptance tests confirm the story was coded correctly

# Samples from a travel website

As a user, I want to reserve a hotel room.

As a vacation planner, I want to see photos of the hotels.

As a user, I want to cancel a reservation.

As a frequent flyer, I want to rebook a past trip so that I save time booking trips I take often.

## Where are the details?

- As a user, I can cancel a reservation.
  - Does the user get a full or partial refund?
    - Is the refund to her credit card or is it site credit?
  - How far ahead must the reservation be cancelled?
    - Is that the same for all hotels?
    - For all site visitors? Can frequent travelers cancel later?
  - Is a confirmation provided to the user?
    - How?

## Details as conditions of satisfaction

- The product owner's conditions of satisfaction can be added to a story
  - These are essentially tests

As a user, I can cancel a reservation.

- Verify that a premium member can cancel the same day without a fee.
- Verify that a non-premium member is charged 10% for a same-day cancellation.
- Verify that an email confirmation is sent.
- Verify that the hotel is notified of any cancellation.

## Details added in smaller sub-stories

As a user, I can cancel a reservation.

As a premium site member, I can cancel a reservation up to the last minute

As a non-premium member, I can cancel up to 24 hours in advance.

As a site visitor, I am emailed a confirmation of any cancelled

# Techniques can be combined

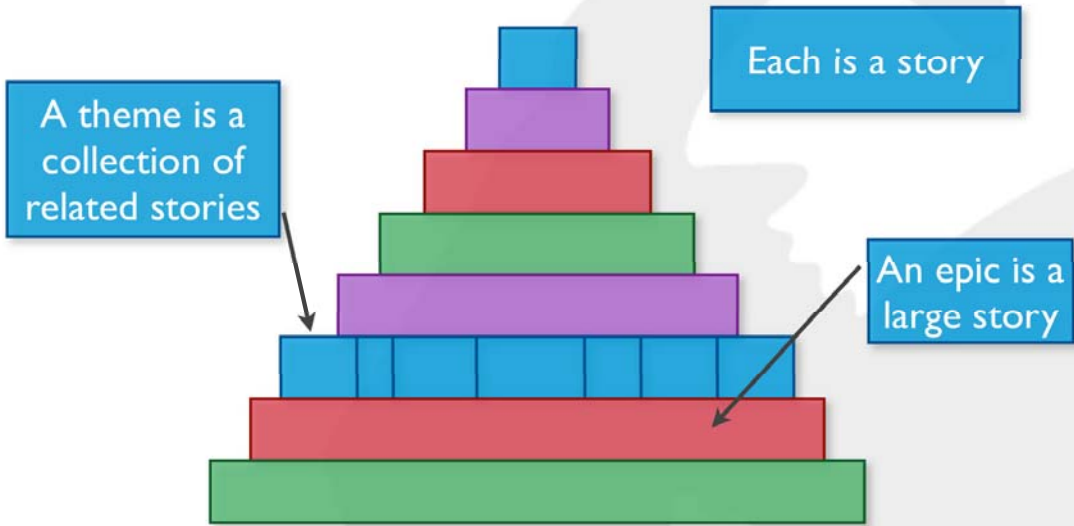

- These approaches are not mutually exclusive
- Write stories at an appropriate level
- By the time it's implemented, each story will have conditions of satisfaction associated with it

# The product backlog iceberg

# User stories on the product backlog

© Mountain Goat Software, LLC

19

# An example

As a VP Marketing, I want to review the performance of historical promotional campaigns so that I can identify and repeat profitable ones.

An epic;  
weeks to implement

As a VP Marketing, I want to select the timeframe to use when reviewing the performance of past promotional campaigns, so that I can identify and repeat profitable ones.

Implementation-size stories;  
days to implement

As a VP Marketing, I can select which type of campaigns (direct mail, TV, email, radio, etc.) to include when reviewing the performance of historical promotional campaigns.

© Mountain Goat Software, LLC

20

# An example

As a VP Marketing, I want to see information on direct mailings when reviewing historical campaigns.

As a VP Marketing, I want to see information on television advertising when reviewing historical campaigns.

As a VP Marketing, I want to see information on email advertising when reviewing historical campaigns.

# Augment as necessary

- User stories don't have to be the end-all, be-all of requirements
- Augment them with written documentation as appropriate
  - Business rules
  - Data dictionaries
  - Use cases
  - Examples of inputs and expected result

## Users and User Roles

© Mountain Goat Software, LLC

23

## “The User”

- Many projects mistakenly assume there's only one user:
  - “The user”
- Write all stories from one user's perspective
- Assume all users have the same goals
- Leads to missing stories

© Mountain Goat Software, LLC

24

# User roles

- Broaden the scope from looking at one user
- Allows users to vary by
  - What they use the software for
  - How they use the software
  - Background
  - Familiarity with the software / computers
- Used extensively in usage-centered design

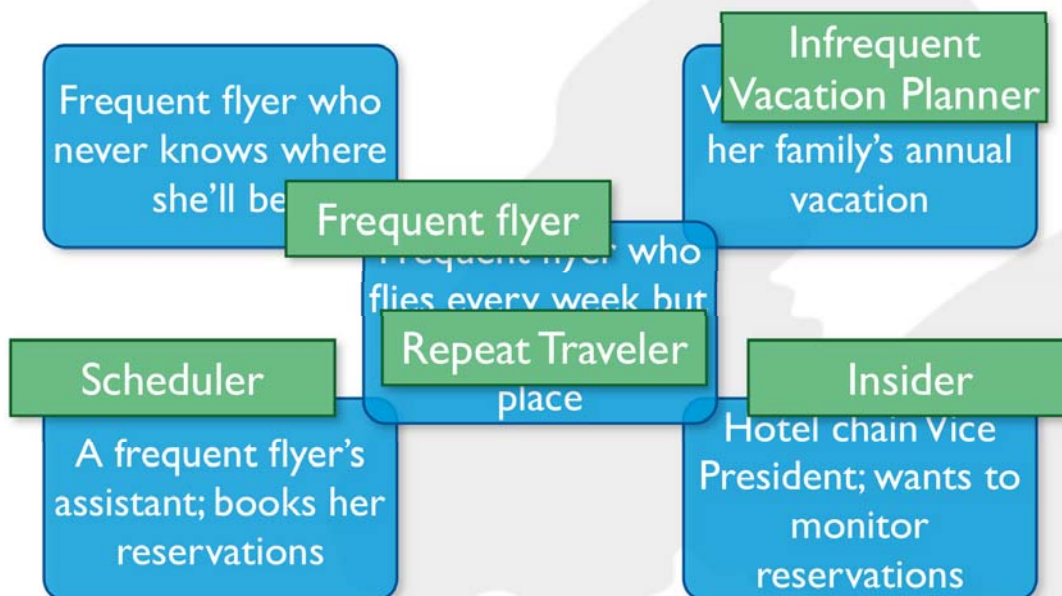

Source: *Software for Use* by  
Constantine and Lockwood (1999).

© Mountain Goat Software, LLC

25

# Common attributes

© Mountain Goat Software, LLC

26

# User role brainstorming

- Brainstorming meeting
  - Customer, developers, anyone who understands a product's intended users
- Everyone grabs a stack of cards
- Write role names on cards
  - As fast as possible and with no judgment
    - No turns
  - Place card on table
  - Call out role name as you place it

# User role brainstorming

We've been hired by to develop a website for the local high school. To get us started they've said they like the school website on the next page.

1. Brainstorm the user roles who will interact with this site.

welcome to science  
Welcome to the Bronx High School of Science's Website. Bronx Science is a place where students and faculty alike experience the power of the motivated mind.  
Bronx Science is not simply an educational institution, it is a home for an ever-growing family with one common goal -- to advance the self and our society.

## User role modeling steps

- Brainstorm an initial set of user roles
- Organize the initial set
- Consolidate roles
- Refine roles

# Organize the initial set

- Arrange cards spatially to indicate overlapping and similar roles
- Use any arrangement rules you want

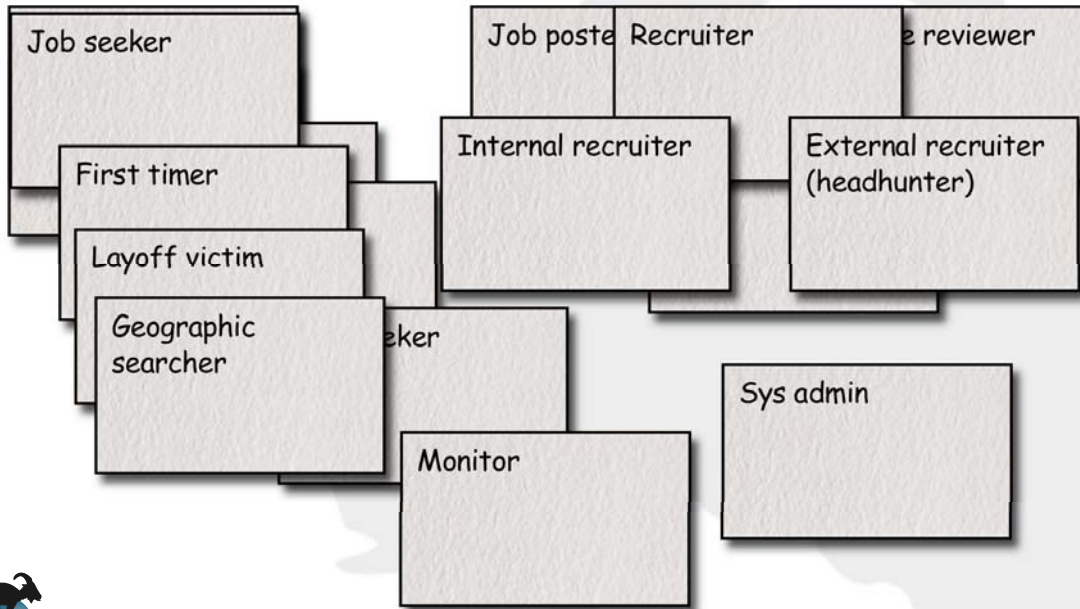

# Consolidate roles

- Discuss what is meant by each card
- Arrange cards spatially to indicate overlapping and similar roles
  - Use any arrangement rules you want
- Look for cards to
  - Combine
  - Replace with a more generic/different card
- Eliminate cards that are unimportant to the success of the product

# Consolidating—an example

# Organize and consolidate

1. Organize your initial set of user roles.
2. Consolidate the user roles.

# Advantages of using roles

Users become tangible

Start thinking of software as solving needs of real people.

Avoid saying “the user”

Instead we talk about “a frequent flyer” or “a repeat traveler”

Incorporate roles into stories

“As a <user role>, I want to <goal> so that <benefit>.”

# System and programmer users

As the payment verification system, I want all transactions to be well-formed XML.

As a programmer, I want an API for deleting widgets from the database.

# Three variations

## Abusers

- Think of who might abuse the system
- Write stories to prevent these abuses

## Extreme characters

- Think of someone unlikely to use your product
- What might they want?

## Personas

- Make a role real with a name, photo and so on

# Techniques for gathering stories

Questionnaires

Observation

User Interviews

Story-writing  
workshops

© Mountain Goat Software, LLC

39

## Questionnaires

- Good technique for learning more about stories you already have
- If you have a large user base, great way to get information to help prioritize stories
- Not effective as a primary means of trawling for new stories

© Mountain Goat Software, LLC

40

# Observation

- Great way to pick up insights
- Two approaches
  - Just observe, with or without user's knowledge
  - Have the user demonstrate to a group how she uses the software

# Observation example

- Stated need:
  - “We need a large text field to summarize.”
- Observed need:
  - Have the system record the user's choices

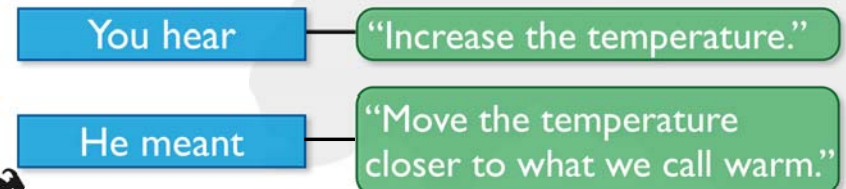

# Interviews

- Default approach taken by many teams
- Selection of interviewees is critical
  - Try to interview as many user roles as possible
- Cannot just ask “So whaddaya want?”
  - Most users are not adept at understanding their true needs

# My context isn't your context

## A horrible question

“Would you like it in a browser?”

“Of course, now that you mention it!”

- A problem:
  - The question is closed
    - {Yes | No}

© Mountain Goat Software, LLC

45

## We can do better

“What would you think of having this app in a browser rather than as a native Windows application, even if it means reduced performance, a poorer overall user experience, and less interactivity?”

- It's open
  - Full range of answers
- But it has too much context

© Mountain Goat Software, LLC

46

## The best way to ask

“What would you be willing to give up in order to have it in a browser?”

- We want to ask questions that are
  - Open-ended
  - Context-free

© Mountain Goat Software, LLC

47

## It's my problem, I know the solution

- Having a problem does not uniquely qualify you to solve it
- “It hurts when I go like this...”

© Mountain Goat Software, LLC

48

## We need to stop asking users

- Since users don't know how to solve their problems, we need to stop *asking*
- We need to *involve* them instead

Empirical design

- Designers of the new system make decisions by studying prospective users in typical situations

Participatory design

- The users of the system become part of the team designing the behavior of the system

© Mountain Goat Software, LLC

49

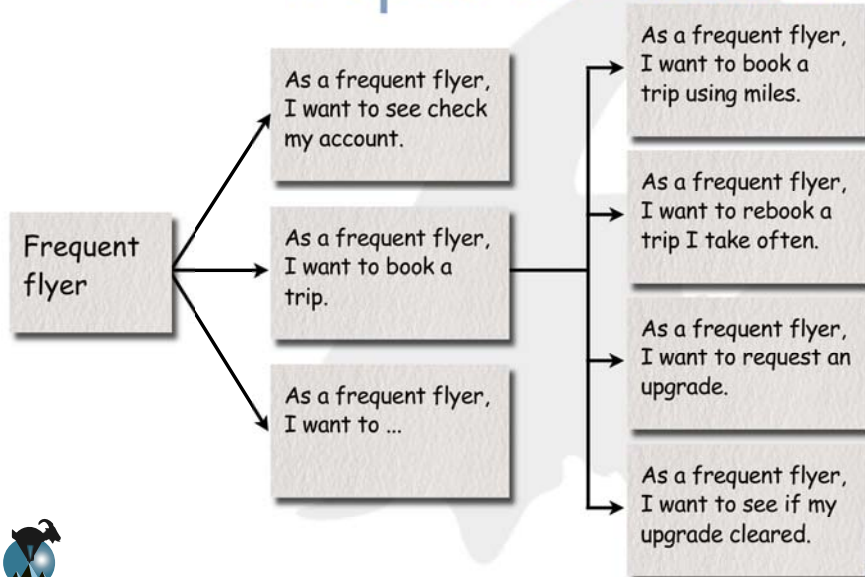

## Story-writing workshops

- Includes developers, users, customer, others
- Brainstorm to generate stories
- Goal is to write as many stories as possible
  - Some will be “implementation ready”
  - Others will be “epics”
- No prioritization at this point

© Mountain Goat Software, LLC

50

## Start with epics and iterate

51

## A story-writing workshop

Start with the roles you've identified. For two or three, think of their top-level goals and write some epics. Then convert a couple of epics into more usable stories.

A tip:

Try this template:

“As a <user role>, I want <goal> so that <reason>.”

© Mountain Goat Software, LLC

52

## INVEST in Good Stories

© Mountain Goat Software, LLC

53

## What makes a good story?

INVEST

Independent

Negotiable

Valuable

Estimatable

Sized appropriately

Testable

Thanks to Bill Wake for the acronym. See [www.xp123.com](http://www.xp123.com).

© Mountain Goat Software, LLC

54

## Independent

- Avoid introducing dependencies
  - Leads to difficulty prioritizing and planning

As a customer, I can pay for the items in my cart with a Visa card.

As a customer, I can pay for the items in my cart with a MasterCard.

As a customer, I can pay for the items in my cart with an American Express card.

- First story will take 3 days to develop
  - It doesn't matter which is first
  - Others will each take 1 day

© Mountain Goat Software, LLC

55

## Making stories independent

Combine the stories

- As a customer, I can pay with a credit card.

Split across a different dimension

- As a customer, I can pay with a first type of credit card.
- As a customer, I can pay two additional types of credit card.

Write two estimates and move on

- 3 days if done first; 1 otherwise

© Mountain Goat Software, LLC

56

# What about this approach?

Extract technical commonalities

- As a programmer, I need to code the infrastructure for processing credit cards.
- As a customer, I can pay with a Visa.
- As a customer, I can pay with a MasterCard,
- As a customer, I can pay with an American Express.

- Sometimes necessary but not ideal
- Why?

© Mountain Goat Software, LLC

57

# Another example

As a user, I can search for a hotel on fields such as hotel brand, quality rating, availability on specific dates, proximity to an attraction (airport, amusement park, etc.), and more.

As a user, I can do an advanced search for a hotel on 2-3 of these fields.

Possible fields: hotel brand, quality rating, availability on specific dates, proximity to an attraction, etc.

As a user, I can search for a hotel on additional fields.

Possible fields: hotel brand, quality rating, availability on specific dates, proximity to an attraction, etc.

© Mountain Goat Software, LLC

58

# Negotiable

- Stories are not contracts
- Do not need to include all details
  - Too many details give the impressions of
    - false precision or completeness
    - that there's no need to talk further
- Need some flexibility so that we can adjust how much of the story gets implemented
  - If the card is contract then it needs to be estimated like a contract
- Not all stories need to be negotiable, but some do

© Mountain Goat Software, LLC

59

# Which is more negotiable?

1

Print dialog allows the user to edit the printer list. The user can add or remove printers from the printer list. The user can add printers either by auto-search or manually specifying the printer DNS name or IP address. An advanced search option also allows the user to restrict his search within specified IP addresses and subnet range.

© Mountain Goat Software, LLC

60

2

As a user, I can add printers to the printer list.

- Auto-search
- Manually specify DNS name
- Manually specify IP address

Note: I've got some "advanced" ways to add printers, too. See me if you have time.

# Valuable

- Stories must be valuable to either:

Users

• As a user, I can search for a job by title and salary range.

Customers

- As the sponsor of this project, I want it to pass an ISO 9001 audit.
- As a sponsor of this project, I want it to produce documentation in compliance with CMMI level 3.
- As a system administrator, I want all configuration information for all users stored in a central location.

# Stories valued by developers

- Should be rewritten to show the benefit

All connections to the database are through a connection pool.

As a purchaser of this system, I want it usable by 50 users with a five-user database license.

All error handling and logging is done through a set of common classes.

As a user, I want all errors presented and logged in a consistent manner.

Rewrite this as a story:

Refactor the payroll processing code.

As a  
I want  
so that

Refactor

To change the structure but not the behavior of code.

## Estimatable

- Because stories are used in planning
- A story may not be estimatable if

Developers lack domain knowledge

As a new user, I am given a diabetic screening.

Developers lack technical knowledge

As any user, I can zoom in on a map without delay.

The story is too big

As a job seeker, I can find a job.

© Mountain Goat Software, LLC

65

## Sized appropriately

- Small stories for the near future
- Epics for further out
- Large stories (epics) are
  - Hard to estimate
  - Hard to plan
    - Won't fit in a single iteration
- Two types of large story
  - Complex story
  - Compound story

© Mountain Goat Software, LLC

66

## Complex stories

- A story that is inherently large and cannot easily be disaggregated into constituent stories
- Very rare
- Some stories look complex because we don't know enough
  - Use a *spike* in those situations
    - First iteration: acquire knowledge
    - Second iteration: do the work

© Mountain Goat Software, LLC

67

## Compound stories

- An epic that comprises multiple shorter stories
- Often hide a great number of assumptions

As a seller [on an auction site], I can post items for sale.

- To post an item for sale you must provide multiple data elements (description, auction end date, etc.)
- Some data elements are required, some are optional.
- Items can be updated after posted.
- Auctions can be cancelled.

© Mountain Goat Software, LLC

68

# Splitting a compound story

## Split along operational boundaries (CRUD)

- As a seller, I can create a new auction listing.
- As a seller, I can update an existing auction listing.
- As a seller, I can delete an auction listing.

# Splitting a compound story

## Split along data boundaries

- As a seller, I can create and update the description of an auction item.
- As a seller, I can add, update or remove a photo from an auction listing.

# More advice on splitting stories

Remove cross-cutting concerns

Don't meet performance targets

Avoid splitting stories into tasks before iteration planning

# Testable

- Tests demonstrate that a story meets the customer's expectations
- Automate, automate, automate

A user must find the software easy to use.

As a novice user, I am able to complete common workflows without training.

A user must never have to wait long for a screen to appear.

As a user, I want to see new screens within 2 seconds 95% of the time.

## Why User Stories

© Mountain Goat Software, LLC

73

1 Stories shift the focus from writing to talking.

If requirements are written down

then

~~The user will get what she wants~~

At best she'll get what was written

"You built what I asked for, but it's not what I need."

© Mountain Goat Software, LLC

74

## Words are imprecise

Entrée comes with soup or salad and bread.

- (Soup or Salad) and Bread
- (Soup) or (Salad and Bread)

© Mountain Goat Software, LLC

75

## Examples

The user can enter a name. It can be 127 characters.

- Must the user enter a name?
- Can it be other than 127 chars?

The system should prominently display a warning message whenever the user enters invalid data.

- What does should mean?
- What does prominently display mean?
- Is invalid data defined elsewhere?

© Mountain Goat Software, LLC

76

2 Stories are equally understandable by developers and customers.

3 Stories support and encourage iterative development.

4 Stories are the right size for planning.

5 Stories support participatory design.

6 Stories emphasize the user's goals not the system's attributes.

### What are we building?

1. The product shall have a gas engine.
2. The product shall have four wheels.
  - 2.1. The product shall have a rubber tire mounted to each wheel.
3. The product shall have a steering wheel.
4. The product shall have a steel body.
