ADAPTING to Agile

Mike Cohn
mike@mountaingoatsoftware.com
June 7, 2010

Mike Cohn

- Founding member and director of Agile Alliance and Scrum Alliance
- Founder of Mountain Goat Software
- Doing Scrum since 1995
- Started my career as a programmer
Agenda

- Why transitioning to agile is hard
- ADAPTing to agile development
- Iterating toward agility
- The role of leadership
- Overcoming resistance

Change is not top-down or bottom-up; it’s both

- Two simplistic views of change:
  - Top down: Powerful leader shares a vision
  - Bottom-up: A team starts and everyone else sees the benefits of the new approach
- But, transitioning to agile is neither top-down nor bottom-up
  - It’s both at the same time
Best practices are tempting

- It is tempting to codify things that work in a given context into best practices
- This leads to inflexible processes‡
- Once we know what’s “best” we stop adapting
- Or even thinking about what we’re doing
- Once we’ve stopped inspecting and adapting we’re not agile, or won’t be for long

‡Anderson, P. “Seven Layers for Guiding the Evolving Enterprise” in The Biology of Business.

The transition process must be congruent with the development process

Part of the move to agile is a move to self-organizing teams
Moving to self-organization requires self-organization!
4

Organizations are unpredictable, living systems

- Traditional view of the organization is as a machine
  - We can dissemble it, study its part, put it back together
  - Once we set it in motion, it will continue in motion

A flawed view of organizational change
We need a different mental model

The organization as a **Complex Adaptive System** (CAS)

- A dynamic network of many agents
  - acting in parallel
  - acting and reacting to what other agents are doing
- Control is highly dispersed and decentralized
- Overall system behavior is the result of a huge number of decisions made constantly by many agents

John Holland in *Complexity: The Emerging Science at the Edge of Order and Chaos* by Mitchell Waldrop

Local goals and gaps

Local agents (individuals, project teams, discipline coworkers) identify local gaps based on their goals

Vision
Differing views of success

**Newtonian View of Success**
Closing the gap with the desired state

**CAS View of Success**
Achieving a good fit with the environment

---

- Each paired statement below and on the next slide describes either the traditional or CAS view of how to change an organization
- Put an X in the appropriate column to indicate which describes the traditional view and which the CAS view

**Agenda**

- Why transitioning to agile is hard
- ADAPTing to agile development
- Iterating toward agility
- The role of leadership
- Overcoming resistance
"I’m the ScrumMaster and ..."

...the developers are not meeting expectations for code quality.

One of our challenges is that we’re still hacking our way through lots of legacy code that isn’t unit-testable or automated yet. This code is mission-critical and the person who has been working mostly on that area of code consistently leaves holes in the design and implementation of new pieces of that code.

We also have the issue with at least one other developer as well.

?  
1. Is this a problem of Awareness, Desire or Ability?  
   • Why?  
2. Thinking about ADAPT, what might you try?
Individual and group change

- All individuals will need to move through the Awareness, Desire, and Ability stage
- But will do so at different rates
- Early adapters and leaders:
  - Use the Promote stage to build Awareness and Desire in later adopters
  - Need to Transfer the impact of agile to groups like Human Resources or the transition will fail

Tools for building...

**Awareness**

- Communicate that there’s a problem
- Use metrics
- Provide exposure to new people and experiences
- Focus attention on the most important reason or two for changing
On the following slides, identify at least five ways to build desire, create ability, promote the transition, and transfer its implications.
Stop!

My thoughts on desire, ability, transfer and promote are on the following pages. You don’t want to see them before you think about your own.
Tools for building...

Desire
- Communicate that there’s a better way
- Create a sense of urgency
- Build momentum
- Get the team to take agile for a test drive
- Align incentives (or, at least, remove disincentives)
- Focus on addressing any fears
- Help people let go
- Don’t discredit the past
- Engage everyone in the transition

Ability
- Provide coaching and training
- Hold individuals accountable
- Share information
- Set reasonable targets
- Just do it

Promote
- Publicize success stories
- Host an agile safari
- Attract attention
Transfer

• Transfer the effects of agile beyond the current group
  • A team transfers to its department
  • A department transfers to its division
  • etc.
• If you don’t transfer, the transition will eventually and inevitably fail
  • Too much organizational gravity pulling us back toward the status quo
• Example:
  • If you don’t align promotions, raises, annual reviews, those will work against you

Agenda

- Why transitioning to agile is hard
- ADAPTing to agile development
- Iterating toward agility
- The role of leadership
- Overcoming resistance
Iterating toward agility

Enterprise Transition Community (ETC)

- Creates a culture in which passion and desire to improve thrive
- Does not direct the transition effort
  - Provides energy, resources, support and guidance
  - Removes organizational impediments to agility
- Encourages Improvement Communities to form
ETC members

- Sponsor
  - From highest level at which change is supported
  - Not a checkbook-only commitment
- Others
  - From any level but driven by desire to improve
- Disbands when the “transition” part of adopting agile is over

ETC responsibilities

- Articulate the reasons for adopting agile
- Stimulate conversation
- Provide resources
- Engage everyone
- Set appropriate aspirations
- Anticipate and address people issues and other impediments
- Encourage simultaneous focus on practices and principles
An ETC’s improvement backlog

<table>

<td>AR</td>
<td>Arie will summarize metrics from his project and see how many teams he can motivate.</td>
</tr>
</tbody>
</table>

Improvement communities (ICs)

- Form around the passion of a small number of people
- Expand from there
- Do the real work of improving how the organization implements agile
- Focus on goals with practical relevance
- Examples:
  - ScrumMaster, Testing, Product Owner, Continuous Integration
Working with an IC

- An IC works with a project team
- Work is not done in an ivory tower
- Most ICs work in 2–4-week iterations
- Disband or refocus when goal has been achieved

ETC Improvement
Backlog

…

Establish an internal program for developing ScrumMasters.

…

An IC Improvement Backlog

Figure out how to identify good candidates to become ScrumMasters (in addition to those who ask to participate in this program).

Establish an internal mentoring program.

Develop some internal classroom training. Which courses? Who can teach them? Can we license courses?

Get budget for next year for external coaching. How many days? At what expected daily rate?

Not everything on an IC’s improvement backlog needs to tie back to the ETC’s backlog.
Improvement backlogs

1. Write some items that you would like an on your organization’s initial improvement backlogs.

2. What improvement communities would you like to see form that could help with some of these improvements?

3. What obstacles are in the way of making these improvements?

4. What obstacles are in the way of forming an ETC or improvement community to get started?

Agenda

- Why transitioning to agile is hard
- ADAPTing to agile development
- Iterating toward agility
- The role of leadership
- Overcoming resistance
Leading an agile transition

- Transition team and other formal leaders must lead the transition
  - but cannot do so in the usual ways
- Self-organizing groups still require leadership
- Lead through example, questions, and focus
  - “Nudge” the organization; Poke and prod;
  - See how the organization responds

Container

- A boundary within which self-organization occurs
- Company, project, team, city, role, nationality

Differences

- There must be differences among the agents acting in our system
- Technical knowledge, domain knowledge, education, experience, power, gender

Transforming Exchanges

- Agents in the system interact and exchange resources
- Information, money, energy (vision)
Using the CDE model

- You can influence how a team self-organizes by altering the:
  - **Containers**
    - formal teams, informal teams, clarify (or not) expectations
  - **Differences**
    - Dampen or amplify them within or between containers
  - **Exchanges**
    - Insert new exchanges, new people, new techniques or tools

Containers

- Enlarge or shrink teams
- Enlarge or shrink the responsibility boundary of teams
- Change team membership
- Create new teams or groups
Differences

- Don’t require consensus
- Creativity comes from tension
- Quiet disagreement is not as good as fierce debate that leads to behavior change
- Ask hard questions
  - Then expect teams to find solutions

Transforming exchanges

- Encourage communication between teams and groups
  - Who isn’t talking who should?
- Add or remove people from exchanges
- Change reporting relationships
- Relocate people
- Compliance with external groups
- Encourage learning
You are the ScrumMaster or coach...

- The next slides describes some teams with some trouble spots. Think about how you might help them by changing their Cotrainers, amplifying or dampening Differences, or changing their Exchanges.
- For each case, identify at least one thing you’d do.
- Note whether you are tweaking their Container, Differences, or Exchanges. (You might be affecting more than one.)

---

1. The team consists of four developers, two testers, a database engineer and you. The developers and testers are not working well together. Developers work in isolation until two days are left in the iteration. They then throw code “over the wall” to the testers.
2. The team is failing to deliver potentially shippable software at the end of each iteration. None of the items they start are 100% finished. They’re close but work is always left to be done in the next iteration.
3. The team seems to be consistently undercommitting during iteration planning. They finish the work they commit but it doesn’t seem like much. The product owner hasn’t complained yet but you’re worried she will soon.

4. Your organization has 20 different agile teams. Each team has its own testers who are starting to go in different directions in terms of preferred tools and approaches.

5. Jeff, a senior developer, is very domineering. During iteration planning the team defers to him on every decision even though he is a horrible estimator. You notice glances that other team members exchange when he suggest very low estimates on some tasks.

6. You are responsible for two teams. Team members on one discuss all sides of various issues before making a decision. This has been working well. On the other team, discussions drag on endlessly because they pursue absolute consensus in all cases.
Self-organization is not something that happens one time

- A team is never done doing it
- The team continually re-organizes in a sense-and-respond manner to its environment
- As you see the team self-organize you can influence, but not control or direct, its path
- We can view this as the evolution of a team

Self-organization proceeds from the premise that effective organization is evolved, not designed. It aims to create an environment in which successful divisions of labor and routines not only emerge but also self-adjust in response to environmental changes. This happens because management sets up an environment and encourages rapid evolution toward higher fitness, not because management has mastered the art of planning and monitoring workflows.

~Philip Anderson

†Anderson, P. “Seven Layers for Guiding the Evolving Enterprise” in The Biology of Business.
Variation, selection & retention

- Evolution is the result of three elements:
  - Variation, selection and retention
- Consider a giraffe:
  - **Variation**: A random mutation that leads to a longer neck
  - **Selection**: The long neck helps it reach food others can’t; so it it more likely to survive and breed
  - **Retention**: The mutation is passed to its descendants

Three ways to influence team evolution

1. Define performance
2. Manage meaning
3. Evolve vicarious selection systems
Define performance

- The principle of selection tells us that the traits that help us survive will be the ones retained
- Managers and leaders send messages about which traits should survive
- What message is your organization sending about the relative importance of short vs. long-term performance?
  - What messages are sent if the organization:
    - Provides training
    - Supports working at a sustainable pace
    - Allows employees time to explore wild ideas
    - Doesn’t exchange meeting a deadline for unmaintainable code

Manage meaning

- Individuals in a CAS respond to the messages they receive; e.g.,
  - bees responding to a “danger” message
  - ants responding to a “food found over here” message
- Leaders can push messages into the system
  - e.g., putting the the team in touch with customers
- Or keep messages out
- Meaning often comes from the stories, myths and rituals that are repeated
  - “We will become profitable this quarter.”
  - “Our GM counts the cars in the lot every day at 5 PM”
3 Evolve vicarious selection systems

- Variation—Selection—Retention
  - Selection was determining which variations will be retained
    - Can take a long time
  - So we often use vicarious selection systems
    - This is an animal that can smell that a food is poisonous, rather than eating it
  - Using only the marketplace as our selection mechanism takes too long
  - Organizations also evolve vicarious selection systems
    - Retrospectives, Google’s 20% policy, improvement communities

Agenda

- Why transitioning to agile is hard
- ADAP Ting to agile development
- Iterating toward agility
- The role of leadership
- Overcoming resistance
### Handling resistance

- Pick one type of resistor. (Or two if you have time.)
- Identify some underlying reasons for the behavior and some things you could try to overcome it.

![Diagram showing the relationship between how they resist and whether they like status quo or dislike agile](image-url)
Why They Resist

Like status quo  Dislike agile

Why They Resist

Passive  Active

Diehard  Saboteur

Skeptic  Follower

Skeptics

- Let time run its course
- Provide training
- Solicit peer anecdotes
- Appoint a champion skeptic
- Push the issue
- Build awareness

Saboteurs

- Success
- Reiterate and reinforce the commitment
- Move them
- Fire them
- Encourage a thriving set of communities
Why They Resist
Like status quo  Dislike agile
Passive  Active
Diehard  Saboteur
Follower  Skeptic

Diehards
- Align incentives
- Create dissatisfaction with the status quo
- Acknowledge and confront fear

Followers
- Change team composition
- Praise the right behavior
- Model the right behavior
- Involve them
- Identify the true barrier (awareness, desire, ability)
### Upcoming public classes
